All brand names and product names are trademarks, registered trademarks or trade names of their respective holders.

GENERAL

Every effort has been made to ensure accuracy, however in some cases changes in the products or availability could occur which may not be reflected in this document. Christie reserves the right to make changes to specifications at any time without notice. Performance specifications are typical, but may vary depending on conditions beyond Christie's control such as maintenance of the product in proper working conditions. Performance specifications are based on information available at the time of printing. Christie makes no warranty of any kind with regard to this material, including, but not limited to, implied warranties of fitness for a particular purpose. Christie will not be liable for errors contained herein or for incidental or consequential damages in connection with the performance or use of this material. Manufacturing facilities in Canada and China are ISO 9001 certified. Manufacturing facilities in Canada are also ISO 14001 certified.

WARRANTY

Products are warranted under Christie's standard limited warranty, the complete details of which are available by contacting your Christie dealer or Christie. In addition to the other limitations that may be specified in Christie's standard limited warranty and, to the extent relevant or applicable to your product, the warranty does not cover:

a. Problems or damage occurring during shipment, in either direction.

b. Problems or damage caused by combination of a product with non-Christie equipment, such as distribution systems, cameras, DVD players, etc., or use of a product with any non-Christie interface device.

c. Problems or damage caused by misuse, improper power source, accident, fire, flood, lightning, earthquake, or other natural disaster.

d. Problems or damage caused by improper installation/alignment, or by equipment modification, if by other than Christie service personnel or a Christie authorized repair service provider.

e. Use of third party product enclosures for environmental protection during outside use must be approved by Christie.

f. Problems or damage caused by use of a product on a motion platform or other movable device where such product has not been designed, modified or approved by Christie for such use.

g. Except where the product is designed for outdoor use, problems or damage caused by use of the product outdoors unless such product is protected from precipitation or other adverse weather or environmental conditions and the ambient temperature is within the recommended ambient temperature set forth in the specifications for such product.

h. Defects caused by normal wear and tear or otherwise due to normal aging of a product.

The warranty does not apply to any product where the serial number has been removed or obliterated. The warranty also does not apply to any product sold by a reseller to an end user outside of the country where the reseller is located unless (i) Christie has an office in the country where the end user is located or (ii) the required international warranty fee has been paid.

The warranty does not obligate Christie to provide any on site warranty service at the product site location.

PREVENTATIVE MAINTENANCE

Preventative maintenance is an important part of the continued and proper operation of your product. Failure to perform maintenance as required, and in accordance with the maintenance schedule specified by Christie, will void the warranty. For preventative maintenance schedules, refer to www.christiedigital.com.

REGULATORY

The product has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the product is operated in a commercial environment. The product generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of the product in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at the user's own expense. Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

CAN ICES-3 (A) / NMB-3 (A)

이 기기는 업무용(A급)으로 전자파적합등록을 한 기기이오니 판매자 또는 사용자는 이 점을 주의하시기 바라며, 가정외의 지역에서 사용하는 것을 목적으로 합니다.

ENVIRONMENTAL

The product is designed and manufactured with high-quality materials and components that can be recycled and reused. This symbol means that electrical and electronic equipment, at their end-of-life, should be disposed of separately from regular waste. Please dispose of the product appropriately and according to local regulations. In the European Union, there are separate collection systems for used electrical and electronic products. Please help us to conserve the environment we live in!

Safety precautions

Learn about the safety precautions related to the Christie CineLife+ RGB PLF projector. This projector is intended for use in a cinema environment.

General safety precautions

Read all safety and warning guidelines before installing or operating the projector.

**Warning!** If not avoided, the following could result in death or serious injury.

- TRIP OR FIRE HAZARD! Position all cables where they cannot contact hot surfaces, be pulled, be tripped over, or damaged by persons walking on or objects rolling over the cables.
- This product must be installed within a restricted access location not accessible by the general public.
- Only personnel who are trained on the precautions for the restricted access location can be granted entry to the area.
- Install the product so users and the audience cannot enter the restricted area at eye level.
- ELECTRICAL and BURN HAZARD! Use caution when accessing internal components.
- High leakage current present when connected to IT power systems.
- FIRE AND SHOCK HAZARD! Use only the attachments, accessories, tools, and replacement parts specified by Christie.
- FIRE HAZARD! Do not use a power cord, harness, or cable that appears damaged.
- Lift equipment must be used to position the product.
- Do not install or operate the projector in any position that does not meet the stated product specifications for alignment and orientation.

**Caution!** If not avoided, the following could result in minor or moderate injury.

- Only Christie qualified technicians are permitted to open product enclosures.

Laser safety precautions

Read all safety and warning guidelines before operating the projector laser.

**Warning!** If not avoided, the following could result in death or serious injury.

- Do not operate the cinema projector without all of its covers in place.
- LASER RADIATION HAZARD! This projector has a built-in Class 4 laser module. Never attempt to disassemble or modify the laser module.
- Do not look directly into the lens when the light source is on. The extremely high brightness can cause permanent eye damage.
- Possible hazardous optical radiation emitted from this product. (Risk group 3)
AC power precautions

Read all safety and warning guidelines before connecting to AC power.

**Warning!** If not avoided, the following could result in death or serious injury.

- SHOCK HAZARD! Only use the AC power cord provided with the product or recommended by Christie.
- FIRE AND SHOCK HAZARD! Do not attempt operation unless the power cord, power socket, and power plug meet the appropriate local rating standards.
- SHOCK HAZARD! Do not attempt operation if the AC supply is not within the specified voltage and current, as specified on the license label.
- SHOCK HAZARD! The optional UPS power cord must be inserted into an outlet with grounding.
- SHOCK HAZARD! Disconnect the product from AC before installing, moving, servicing, cleaning, removing components, or opening any enclosure.
- Install the product near an easily accessible AC receptacle.

**Caution!** If not avoided, the following could result in minor or moderate injury.

- FIRE HAZARD! Do not use a power cord, harness, or cable that appears damaged.
- FIRE OR SHOCK HAZARD! Do not overload power outlets and extension cords.
- SHOCK HAZARD! Power supply uses double pole/neutral fusing.

Light intensity hazard distance

This projector has been classified as Risk Group 3 as per the IEC 62471-5:2015 standard due to possible hazardous optical and thermal radiation being emitted.

**Warning!** If not avoided, the following could result in serious injury.

- PERMANENT/TEMPORARY BLINDNESS HAZARD! Operators must control access to the beam within the hazard distance or install the product at the height that prevents exposure of spectators’ eyes within the hazard distance. The hazard zone must be no lower than 2.5 meters (US installations) or 2.0 meters (global installations) above any surface upon which any persons are permitted to stand and the horizontal clearance to the hazard zone must be a minimum 1.0 meters.
- EXTREME BRIGHTNESS! Do not place reflective objects in the product light path.

The following diagram and table show the zones for ocular and skin hazard distances:
• A—Hazard zone. The region of space where the projection light from the laser-illuminated projector is above emission limits for Risk Group 2. The light intensity may cause eye damage after a momentary or brief exposure (before a person can avert his or her eyes away from the light source). The light may cause skin burns to occur.

• B—Hazard distance. Operators must control access to the beam within the hazard distance or install the product preventing potential exposure of the spectators’ eyes from being in the hazard distance.

• C—No access zone. Horizontal clearance of the no access zone must be a minimum of 1.0 meters.

• D—Vertical distance to hazard zone. The hazard zone must be no lower than 2.5 meters (US installations) or 2.0 meters (global installations) above any surface upon which any persons are permitted to stand.

• E—Represents the top view of the projector.

• F—Represents the side view of the projector.

The following table lists the hazard distance for the Christie projector lens with the zoom adjusted to its most hazardous position.

**CP4450-RGB**

### Product labels

Learn about the labels that may be used on the product. Labels on your product may be yellow or black and white.

### General hazards

Hazard warnings also apply to accessories once they are installed in a Christie product that is connected to power.

#### Fire and Shock Hazard

- To prevent fire or shock hazards, do not expose this product to rain or moisture.
- Do not alter the power plug, overload the power outlet, or use it with extension cords.
- Do not remove the product enclosure.
- Only Christie qualified technicians are authorized to service the product.

#### Electrical Hazard

- Risk of electric shock.
- Do not remove the product enclosure.
- Only Christie qualified technicians are authorized to service the product.
- Electric shock hazard. To avoid personal injury, disconnect all power sources before performing maintenance or service.
- Electrocution hazard. To avoid personal injury, always disconnect all power sources before performing maintenance or service procedures.
- Hot surface hazard. To avoid personal injury, allow the product to cool for the recommended cool down time before performing maintenance or service.
Fan hazard. To avoid personal injury, keep hands clear and loose clothing tied back. Always disconnect all power sources before performing maintenance or service procedures.

Laser hazard. To avoid personal injury, avoid eye or skin exposure to direct or scattered radiations.

**Mandatory action**

Consult the service manual.

Disconnect all power sources before performing maintenance or service procedures.

**Electrical labels**

Indicates the presence of a protective earth ground.

Indicates the presence of an earth ground.

**Additional hazard labels**

Indicates Class 4 laser radiation when open. Avoid eye or skin exposure to direct or scattered radiation.

**CLASS 1 LASER PRODUCT IEC 60825-1:2014**

Wavelengths: 450 nm - 645 nm

FDA laser variance (US projectors only). This product is in conformity with performance standards for laser products under 21 CFR 1040, except with respect to those characteristics authorized by Variance Number 2019-V-3343 effective on August 16, 2019.
Indicates a light hazard. Do not look directly into the lens. The extreme high brightness can cause permanent eye damage. Class 1 Laser Product - Risk Group 3 according to IEC 60825-1:2014 and IEC 62471-5:2015.

Indicates high leakage current. Earth or ground connection essential before connecting the power supply.

Indicates a light hazard. Do not look directly into the lens. The extreme high brightness can cause permanent eye damage.

Indicates moving parts hazard for the motorized lens mount. To avoid personal injury, keep hands clear and clothing tied back.
Introduction

This manual is intended for professionally trained operators of Christie high-brightness CineLife+ RGB PLF projection systems.

For complete production documentation and technical support, go to www.christiedigital.com.

Product documentation

For installation, setup, and user information, see the product documentation available on the Christie Digital Systems USA Inc. website. Read all instructions before using or servicing this product.

To access the documentation from the Christie website:

- Scan the QR code using a QR code reader app on a smartphone or tablet.

List of components

Verify that all components were received with the projector.

- Touch panel, touch panel harness, and panel mounting arm
Key features

Understand the important features of the projector.

- Solid-state Christie RealLaser™ RGB laser illumination
- Three-chip 1.38 inch 4K DLP™ light engine
- Christie CineLife+™ electronics platform for ultra-fast processing
- High frame rate playback of 4K at 120 Hz, for premium, large format cinema venues
- Dual, direct-coupled laser modules integrated in the projector chassis
- Ability to work with Mystique software
- 4K 3D playback capability
- LiteLOC™ color lock feature for constant image brightness and color
- Compatible with ultra high contrast (UHC) lens suite
- External chiller unit with exhaust adapter

Installing and setting up

Learn how to position and install the projector.

Site requirements

To safely install and operate CineLife+ RGB PLF projectors, the installation location must meet these minimum requirements.

Physical operating environment

- Ambient temperature (operating) 15°C to 30°C (59°F to 86°F)
- Humidity (non-condensing) 10% to 80%
- Operating altitude 0 to 2000 meters (0 to 6562 feet)

Projector exhaust ducting

Sufficient ventilation is required around the projector to regulate the temperature of the projector electronics and optical components.

The projector has an 8" built-in exhaust duct. If necessary, exhaust HVAC ducts can be connected to the projector.

The installation site must provide an airflow 450 cubic feet per minute (CFM) at 1 to 1000 meters elevation, and must accommodate a heat load of 4 kW.

- For each additional 1000 meters above sea level, increase the airflow (CFM) value by 15%. If an extraction duct is not used, the operating temperature range is restricted to 10°C to 25°C at a maximum altitude of 2000 meters.

Projector power connections

The projector requires two, 30A maximum rated, certified wall circuit breakers (one for each Main Input). The wall circuit breakers must be part of the building and easily accessible.

The projector must be connected to power using hard-wired connections. The projector light source requires the permanent AC connections to operate. A qualified electrician is required to connect the projector to AC power.

There is also an available connector for an uninterruptible power supply (UPS) to provide backup power for the projector electronics only. The UPS connection requires a 20A maximum rated circuit breaker.

Chiller power connection

The chiller is connected to AC power through a power supply terminal located at the front of the chiller unit.
A qualified electrician is required to connect the chiller unit to AC power. For detailed information, refer to the documentation provided by the chiller manufacturer. For electrical rating information, refer to the license label on the chiller.

**Preparing the installation site**

Ensure the installation area is ready for the components.

1. Clear the installation area.
2. Post laser hazard warning signs at all entry doors.
3. Place each component near its installation location.

**Lifting and positioning the projector**

Safely lift and position the projector in the location where it will be used.

**Warning!** If not avoided, the following could result in death or serious injury.

- Lift equipment must be used to position the product.
- Do not install or operate the projector in any position that does not meet the stated product specifications for alignment and orientation.

This product must be installed in a landscape orientation, with all four feet supported on a level surface. Do not install or operate the projector in an inverted position. If your site has any installation requirements other than a typical theater projection booth, contact Christie for assistance.

Before lifting and positioning the projector, refer to the light intensity hazard distances.

1. Using appropriately rated lift equipment, lift up the projector and move it to the location where it will be used.
2. If you are installing the projector with the optional pedestal (P/N: 163-126100-XX), follow the instructions provided with that accessory. For more information on available accessories, see the CineLife+ RGB PLF Specifications Guide (P/N: 020-103074-XX).

3. Position the projector so it is centered and parallel with the theater screen. If space is limited, aim the projector slightly off-center and use lens offset to center the image on the screen.

Related information

Light intensity hazard distance (on page 7)

Connecting to power

The recommended setup is to provide two hard-wired connections to AC power. When connecting the projector to AC power, follow all electrical codes for your location.

**Warning!** If not avoided, the following could result in death or serious injury.

- Always connect the ground or earth first to reduce shock hazard.
- FIRE HAZARD! Do not use a power cord, harness, or cable that appears damaged.
- FIRE AND SHOCK HAZARD! Do not attempt operation unless the power cord, power socket, and power plug meet the appropriate local rating standards.
- SHOCK HAZARD! Do not attempt operation if the AC supply is not within the specified voltage and current, as specified on the license label.
- SHOCK HAZARD! A dedicated, protected ground or earth wire must be installed on the product by Christie qualified technicians or electricians before it can be connected to power.
- A certified electrician must be present during installation to ensure the installation meets the local electrical code.

**Caution!** If not avoided, the following could result in minor or moderate injury.

- Use an appropriately sized strain relief connector with the knockout plate provided, to ensure adequate environmental sealing and to prevent the AC supply cable from accidentally being torn out or rubbing against the knockout plate.

- Two, 30A maximum rated, certified wall circuit breakers are required. They must be part of the building and easily accessible.
- Use a minimum of 12 AWG copper wire, grounding included, for the connection of the main AC supply to the projector’s ground lug.
- Either copper or aluminum is acceptable as conductor wiring material to the terminal block.
1. Remove the rear cover of the projector by unscrewing the six captive screws.
2. On the back right side of the projector, remove the eight screws holding the two AC receptacle knockout plates and then remove the two plates.

The AC supplies are routed to each terminal block through an appropriate strain relief mounted on the knockout plates.
3. To open the AC input area of the projector, remove the six screws holding the cover and swing the cover downwards to open it.

4. Taking the approved line cord for your location, strip the cable jacket on the line cord to expose a 120 mm length of the bundled wires.

5. Cut the Line (black or brown) and Neutral (white or blue) wires to shorten them to a length between 80 to 100 mm.

6. Using a wire stripper, strip the insulation from each individual wire to expose 10 mm of bare wire on the end.

7. Repeat steps 4 to 6 for the second line cord.

8. Pass the wires through the strain reliefs on each knockout plate and through the AC input cover.

9. For each terminal block, fasten the bare end of the wires into the Ground (G), Line (L), and Neutral (N) terminal connectors, starting first with the Ground (green) connection, followed by the Line (black or brown) and Neutral (white or blue) connections.
10. Carefully lift the AC input cover into place, ensuring that the cover does not pinch any of the wires.

11. Re-attach the cover using the six screws.

12. Using the eight screws, re-attach the two knockout plates and ensure the appropriate strain relief is in place for each line cord.

13. Using the six captive screws, reinstall the rear cover of the projector.

Connecting to an uninterruptible power supply

An uninterruptible power supply (UPS) allows the projector head electronics to remain operable during a power failure.

**Warning!** If not avoided, the following could result in death or serious injury.

- SHOCK HAZARD! The optional UPS power cord must be inserted into an outlet with grounding.

The following table lists the part numbers for the optional UPS power cords for each region.

The UPS is connected through two 12V power supplies on the projector. The following illustration shows the power supplies and connections.

- A 12V power supply A
- B 12V power supply B
- C UPS B plug
Before connecting the UPS device, ensure the projector is disconnected from power.

1. Remove the rear cover of the projector by unscrewing the six captive screws.
2. Disconnect the IN-LINE A input plug from the 12V power supply A (top left).
3. Remove the protective cap from the UPS A plug.
4. Connect the UPS A plug to the 12V power supply A.
5. Place the protective cap from the UPS A plug on the IN-LINE A input plug.
6. Repeat steps 2 to 5 for the UPS B and IN-LINE B plugs on the 12V power supply B (top right).
7. Reinstall the rear panel of the projector.
8. Obtain the appropriate line cord for your region and plug the cord into the UPS device, and then into the UPS inlet on the projector.

Installing the lens

The lens seals the projection head, preventing contaminants from entering the main electronics area. Before installing the lens, ensure that you turn off the projector and the circuit breaker switches.
Do not operate the projector without a lens installed. Install a lens plug when you install or transport the projector.

1. Remove the lens caps from the front and rear of the lens.
   
   Lens caps must be removed or they can melt and damage the lens.

2. Position the lens so that the **UP** label is facing upward.

3. Turn the clamp on the lens mount to the open position.

4. Fully insert the lens into the lens mount opening without turning, until it reaches the stop position.

5. Connect the lens zoom motor to the two zoom motor harness connectors.

6. Lock the lens assembly in place by rotating the lens clamp downward.
Installing the touch panel

The touch panel controls projector functions and provides quick access to projector information. The touch panel can be mounted on the rear panel or either side of the projector.

1. Remove the touch panel and the mounting arm from their packaging.
2. Attach one end of the touch panel mounting arm over the ball joint on the rear of the touch panel.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Mounting arm</td>
</tr>
<tr>
<td>B</td>
<td>Ball joint</td>
</tr>
</tbody>
</table>

3. While supporting the touch panel, fit the other end of the touch panel mounting arm over the ball joint on the rear panel of the projector.
4. Tighten the mounting arm until it fits tightly on the ball joint.

5. Connect the touch panel USB cable to the USB port on the rear of the touch panel.
6. Connect the other end of the USB cable to a USB port on the projector input panel.
7. To install the TPC on either side of the projector, uninstall the four screws securing the ball mount and remove it.
   Leave the small adapter puck with the four screws installed.
8. Select a side to install the ball mount with the three button head screws.
   The ball mount has hole patterns for 4-point and 3-point mounting.
9. Install the TPC to the new ball location.
10. To turn the touch panel on, press the power button on the top of the panel.
    If the projector is not connected to AC power with breakers in the ON position, you cannot turn the touch panel on.

To ensure that the touch panel starts up successfully, the touch panel must be connected to the projector before the projector is powered on.

**Projector power modes**

The CineLife+ RGB PLF projectors track laser operation hours for the laser optical sub-systems (LOS).
The projector operates with the following power modes:
## Mode Description

<table>
<thead>

</tbody>
</table>

### Setting up the chiller unit

For detailed information on setting up the chiller, refer to the documentation provided by the manufacturer of the chiller unit.

Once the chiller is connected to AC and the chiller communication cable is connected to the projector, the projector controls the chiller automatically to maintain the required coolant temperature.

### Connecting the chiller communication cable

The chiller communication cable is connected through a signal terminal located at the front of the chiller unit. The connection allows communication between the projector and the chiller.

The chiller communication cable includes an RS-232 connector, attached cable with rubber grommet, and three terminal connectors.

The installation of the chiller communication cable must be performed by a Christie qualified technician.

1. Remove the cover for the signal terminal by unscrewing the two cover screws.
2. Connect the A, B, and PE harness connectors to the corresponding terminals. Do not use the H1, H2, or H3 terminals.

3. Tighten the screws at each terminal.

4. Re-attach the signal terminal cover using the two cover screws. To avoid pinching the cable, ensure the cable and rubber grommet are placed inside the cover cutout.

5. Connect the RS-232 connector to a serial cable and into the RS-232 communication port on the projector.
Connecting the chiller power cable

The chiller is connected to AC power through a power supply terminal located at the front of the chiller unit.

The wires of the supplied power cord are connected to the three terminals in the power supply terminal.

- A qualified electrician is required to connect the chiller unit to AC power. For detailed information, refer to the documentation provided by the chiller manufacturer.
- For electrical rating information, refer to the license label on the chiller. Additional information is available in the chiller’s product documentation.

1. Remove the cover for the power supply terminal by unscrewing the two cover screws.

2. Ensure the rubber grommet is installed on the cable at the connector end. The grommet provides strain relief protection for the power cable.
3. Connect the L, N, and PE harness connectors to the corresponding terminals.

4. Tighten the screws at each terminal.

5. Route the power cable through the slot provided on the terminal block cover. To avoid pinching the power cable, ensure the cable and rubber grommet are placed inside the cover cutout.
6. Re-attach the terminal block cover using the two cover screws.
7. Plug the power cable into an appropriately rated AC power outlet.

Connecting the coolant lines

The required coolant lines and hose accessories are available in the Christie Chiller Setup Kit (P/N: 163-127101-XX).

- Make sure the coolant lines connecting the projector and chiller are installed at floor level. Installing the coolant lines at a higher elevation, such as across a ceiling, can result in a backflow through the lines and an overflow of the chiller reservoir. If your site requires installation on different levels, contact Christie technical support for further information.
- In dual projector installations, verify that the chiller communication cables are connected correctly between each projector-chiller pair and that the cables are not cross-connected relative to the coolant lines.

1. Position the chiller.
2. Install the required hose accessories on the chiller inlet and outlet ports, including:
   - inlet hose from the chiller inlet port to the chiller filter
   - hose and elbow fitting at the filter inlet
   - outlet hose and elbow fitting at the chiller outlet port
The inlet filter and hose barbs required for the chiller are pre-installed.
3. Connect the coolant lines between the chiller and the projector. To avoid cross-connections, the supply and return lines have specific male and female quick connectors that connect into the projector.
   a) Connect the open end of the Chiller Outlet hose to the chiller outlet port and tighten the required worm gear clamp.
   b) Attach the Chiller Outlet quick connector (male) to the projector inlet port (female).
   c) Connect the open end of the Chiller Inlet hose to the chiller inlet port (at the filter) and tighten the required worm gear clamp.
   d) Attach the Chiller Inlet quick connector (female) to the projector outlet port (male).
Installing the chiller duct

Installing a chiller duct and exhaust conduit allows warm air generated by chiller to be removed from the projection room.

1. Attach the duct over the exhaust fan on the top of the chiller unit.
   The duct is available in the Christie chiller setup kit (P/N: 163-127101-XX).
   For detailed information on connecting the chiller duct, refer to the Christie Chiller Setup Kit Instruction Sheet P/N: 020-103145-XX.

2. If required, a reducer duct is also provided in the kit and can be installed over the base duct to accommodate smaller diameter exhaust conduits.

3. Once installed, connect the duct into the exhaust conduit to vent the heated air outside of the projection room.

Filling and starting the chiller

Ensure the coolant lines are connected to the projector and all connections are tightened.

1. Open the chiller reservoir fill cap.
2. Using the provided funnel, fill the chiller reservoir with the required coolant (Propylene Glycol P/N: 163-130105-XX).

3. Start the chiller and allow the coolant lines to fill.

4. Check the coolant level in the reservoir and top up the coolant as required.
   
   For detailed information on operating and maintaining the chiller, refer to the product documentation provided by the chiller manufacturer.

5. On the projector touch panel, tap Laser Settings > Laser Power/LiteLOC Setup, and under Chiller Setpoint, set the required temperature for the chiller.
   The recommended chiller set point temperature is 24°C.

6. Verify that coolant is flowing in the correct direction and that there are no leaks in the system.

7. Ensure the chiller communication cable between the projector and the chiller is connected correctly.

   To avoid thermal shutdown conditions in dual projector installations, Christie recommends running each chiller and its attached projector separately, with light on, to confirm that chiller communication cables are not cross-connected relative to the coolant lines.

**Related information**

*Setting the chiller setpoint* (on page 38)
*Creating a new laser file* (on page 44)
Setting the chiller setpoint

The chiller setpoint represents the temperature of the coolant that is supplied to projector.

The default chiller setpoint temperature is 24°C. The default setting addresses many typical projection booth conditions, ensuring maximum projector brightness and operating efficiency.

If room temperatures or relative humidity are allowed to rise, the maximum power setting available for the lasers is reduced and brightness is decreased as a result.

The projector is equipped with sensors that monitor ambient temperature and humidity. When selecting the chiller setpoint, use the actual temperature and relative humidity of the projection booth expected during operating conditions. Selecting a setpoint that does not reflect actual show environment conditions may result in a sub-optimal projection image.

1. Use the reference chart below to determine the coolant temperature required for your site.

   **CP4450-RGB Chiller Setpoint Temperature**

2. On the Y axis of the chart, find the Maximum Room Temperature expected in the projection booth.
3. On the X axis of the chart, find the Maximum Room Relative Humidity.
4. To identify the correct chiller setpoint temperature, find the intersection of the two rows.
   Choosing a chiller setpoint temperature that falls outside the green area means that projector brightness is reduced.
5. On the projector touch panel, tap Laser Settings > Laser Power/LiteLOC Setup, and follow the steps for creating a new laser file, including setting the chiller setpoint value.

Related information

Creating a new laser file (on page 44)
Maintaining the chiller

For detailed information on maintaining the chiller equipment, refer to the product documentation provided by the chiller manufacturer.

To identify any leaks or problems, perform regular visual inspections of the chiller equipment and connections to the projector.

Follow the recommended coolant replacement and preventative maintenance schedules. For more information, contact Christie technical support.

Dispose of coolant in accordance with local regulations.

System operation

Understand the correct sequence for powering up and operating the system.

The connected chiller must always be turned on first and turned off only after the projector is turned off.

The system is ready to operate when the following steps are completed:

1. The connected chiller unit is powered on.
2. The projector's main power switches are ON.
3. Communication between the projector and the connected chiller is confirmed, and coolant temperatures are correctly maintained.

   If a thermal shutdown occurs in a dual projector installation, verify that the chiller communication cables are connected correctly between each projector-chiller pair. This ensures that there is no cross-connection relative to the coolant lines.

Related information

Connecting the chiller communication cable (on page 30)
Connecting the coolant lines (on page 34)
Filling and starting the chiller (on page 36)

Turning the projector on or off

Turn on the projector to display content, or turn off the projector to conserve energy.

To operate the projector, the circuit breakers must be in the ON position. If you are servicing the projector or removing the protective covers, ensure that the MAIN and UPS circuit breakers are in the off position.

• In the right toolbar, tap and hold Power.

   If the light source is on when turning off the projector, the light source enters a ten-minute cool-down period automatically.
Logging on to the projector

Log on to the projector to access projector menus.

1. Tap **Login**.
2. In the User list, select a user name.
3. Enter your password.
4. Tap **Login**.

Turning the light source on or off

Turn the light source on to display content or view test patterns, turn the light off to extend the life of the lasers.

- To turn the light source on or off, in the right toolbar, tap and hold **Light**.
  
  If you turn on the light source when the projector power is off, power is turned on automatically.
  
  Allow the projector to cool down for 10 minutes after turning it off.
  
  If you turn on the laser source while the projector is cooling down, the lasers turn on.

Activating marriage

You must complete marriage to display content and to comply with the Digital Cinema Initiatives (DCI) specification.

For more information on marriage, refer to *CineLife+ RGB PLF User Guide (P/N: 020-103073-XX)*

You cannot complete marriage remotely.

1. In the left navigation menu, tap **Service Setup** > **Marriage Setup**.
2. Tap **Start** and complete the Marriage Setup wizard.
3. Tap **Finish**.
4. Verify that the marriage ring is installed correctly and an anti-tamper alarm does not appear on the touch panel.

Completing the installation checklist

Complete the provided installation checklist (P/N: 020-103137-XX) and return it to Christie.
Connecting devices to the projector and establishing communication

To display content, you must connect a device that is capable of storing or playing content to the projector.

Projector head connections and status LEDs

Understand the inputs on the projector.

Connecting the projector to a network

The CineLife+ RGB PLF projectors can be connected to various media devices and wired networks. For detailed information on connecting the projector to a device or network, see the CineLife+ RGB PLF User Guide (P/N: 020-103073-XX).

Connecting the devices to the 3D port

For information on connecting devices to the 3D port on the projector, refer to the product documentation for the device you are using.
Managing the light source

Learn how to configure a laser file and use the projector's LiteLOC™ feature. The laser file allows you to control the power settings of the red, green, and blue (RGB) lasers. The LiteLOC™ feature ensures that color and brightness are held at the level you set. You can create multiple laser files to manage varying screen sizes, brightness requirements, chiller setpoint temperatures, and types of content (such as 2D, 3D, and alternative content).

Creating a new laser file

Create a laser file to store the power settings for the RGB laser light source and the chiller setpoint. The maximum (MAX) power limit for Red and Green changes according to the value set for the chiller setpoint temperature. For Red, Green, and Blue power levels, system stability may be affected if levels are set below the minimum (MIN) power limit shown. To ensure color and brightness are held at the required levels for your installation, Christie recommends that you enable LiteLOC™ for each laser file you create.
When refining the laser power settings, the amount of time required to re-stabilize the projector depends on the size of the adjustment. For very small adjustments to the chiller setpoint or power settings, the projector requires only 1 or 2 minutes to re-stabilize. For larger adjustments, the projector may require up to 15 minutes to re-stabilize.

1. In the left navigation pane, tap **Laser Settings > Laser Power/LiteLOC Setup**.

2. To activate the controls, tap the **Display White Test Pattern** slider.

3. To create a new laser file, tap **Create**.

4. In the Create dialog, type a name for the new laser file and tap **Create**.

5. If the laser file will be associated with a 3D channel, tap the **3D Sync** slider.

6. Under Chiller Setpoint, tap the plus and minus signs (or drag the temperature slider) to indicate the maximum setpoint temperature.

   The system uses the maximum setpoint temperature to calculate the light output. The default chiller setpoint value is 24°C. A lower setpoint generally results in increased brightness and better efficiency. A higher setpoint will reduce the maximum power setting available for the lasers. The chiller setpoint temperature must reflect actual operating conditions.

7. Set the approximate Red, Green, and Blue power levels as required for your projection environment and allow the projector to stabilize for 15 minutes.

   System stability may be affected if you set a power level below the minimum power level recommended.

   When setting the Red or Green power level, Christie recommends setting a level below the maximum (MAX) limit shown. A value below the maximum limit ensures an optimal brightness that can be maintained over time.

8. If color or brightness is not at the target level, refine the Red, Green, and Blue power settings to achieve the target, and then allow the projector to re-stabilize for an additional 3 to 5 minutes.

   The projector is considered stable when there are no further adjustments and you obtain the same screen state results after two sets of measurements, 5 minutes apart.

9. Once the correct color and brightness are achieved and the projector has stabilized, tap the **LiteLOC** slider to lock the settings.

   The color of the slider turns to green to indicate the settings are locked. The projector’s LiteLOC™ system maintains the brightness and color levels.

10. To save the new laser file, tap **Save**.

    Color sensor (CSense) data are displayed on the interface to provide feedback on the current color sensor information.

**Related information**

*Setting the chiller setpoint* (on page 38)

**Modifying an existing laser file**

Modify the settings in the laser file to change the laser power settings or the chiller setpoint.

When refining the laser power settings, the amount of time required to re-stabilize the projector depends on the size of the adjustment. For very small adjustments to the chiller setpoint temperature or power settings, the projector requires only 1 or 2 minutes to re-stabilize. For larger adjustments, the projector may require up to 15 minutes to re-stabilize.
1. In the left navigation pane, tap **Laser Settings > Laser Power/LiteLOC Setup**.

2. To begin modifying the settings, tap the **Display White Test Pattern** slider.

3. From the Laser File list, select the laser file to edit.

4. To unlock the file, tap the **LiteLOC** slider.
   The color of the slider turns to gray to indicate the settings are unlocked.

5. Adjust the Chiller Setpoint and the power levels for Red, Green, and Blue as required to achieve the correct color and brightness on screen.

6. Once the correct color and brightness are achieved and the projector has stabilized, tap the **LiteLOC** slider to lock the settings.
   The color of the slider turns to green to indicate the settings are locked.

7. To save the new settings, tap **Save**.

### Copying existing laser settings to a new file

Copy an existing laser file when you want to create a new file with similar settings.

1. In the left navigation pane, tap **Laser Settings > Laser Power/LiteLOC Setup**.

2. Tap the **Display White Test Pattern** slider.

3. From the Laser File list, select the file you want to copy.

4. To save the new laser file, tap **Save As**.

5. Type a new name for the laser file and then tap **Save**.

6. Adjust the maximum expected temperature and power settings as required for the new configuration.

### Deleting a laser file

Delete a laser file when the configuration is no longer required.

1. In the left navigation menu, tap **Laser Settings > Laser Power/LiteLOC Setup**.

2. Tap the **Display White Test Pattern** slider.

3. In the Laser File list, select the file to delete.

4. Tap **Delete**.

5. To confirm the deletion, tap **Delete**.
Adjusting the image

Learn how to adjust image geometry so it displays correctly.

Calibrating the Intelligent Lens System

On CineLife+ RGB PLF projectors, the Intelligent Lens System (ILS) is activated by default.

Use the Auto Calibrate feature of the ILS to find and compensate for motor backlash, and to determine the movement range for the currently installed lens.

1. In the left navigation menu, tap Image Settings > ILS File Setup.
2. From the ILS File list, select an available ILS file.
3. Tap Auto Calibrate.
4. Tap Continue.

The system performs the lens calibration.

Correcting vignetting

An image that is brighter at the center than it is at the sides needs vignetting correction.

If your image suffers from vignetting, the lens has reached the end of its offset travel range.

If your installation does not allow the image to be centered with the center of the screen, move the entire projector in the direction of lens travel.

Adjusting tilt and leveling the projector

To ensure optimum performance, install the projector so it is centered and parallel with the screen.

To compensate for tilt or offset, you can adjust the projector feet and the lens mount position.

This product must be installed in a landscape orientation, with all four feet supported on a level surface. Do not install or operate the projector in an inverted position. If your site has any installation requirements other than a typical theater projection booth, contact Christie for assistance.

The front-to-back tilt of the projector must not exceed 15° in a downward direction. The side-to-side tilt must be within +5° to -5° of level.

1. To adjust the height of the projector, loosen the lock nut on the adjustable feet on the bottom of the projector.
Correcting keystone effect

Learn how to adjust the image to correct keystone effect.

Keystone effect occurs when you project an image onto the screen at an angle. As a result, the image appears distorted and resembles a trapezoid.

When making the adjustments, set the light source to minimum power.

1. If the image suffers from slight keystone effect, it can be corrected with electronic cropping.
2. If the keystone effect is severe, you can unevenly adjust the feet to compensate for projector tilt. It is recommended that you use lens offset to align the center of the image to the center of the screen before you correct the keystone effect.
3. If one side of the image is longer than another, adjust the tilt and level of the projector.

Displaying a test pattern
Display a test pattern to refine and adjust the projected image, or to diagnose and correct image issues.

1. In the right toolbar, tap Test Patterns.
2. Tap Full Screen.
3. Tap a test pattern. When a test pattern is active, a blue bar appears below the test pattern icon in the right pane.
4. To display a 2D test pattern in 3D mode, select the 3D Sync option. The 3D Sync option is selected automatically for 3D test patterns. 3D test patterns cannot be displayed in 2D mode.
5. To change the frame rate of the test pattern display, select from the available Frame Rate options:
   • For 2D test patterns, the available frame rates are 24, 30, 48, and 60 Frames Per Second (FPS). The default value is 24 FPS.
   • For 3D test patterns, the available frame rates are 48 and 60 FPS. The default value is 48 FPS.
Changing the frame rate of the display can assist with color measurement when working with corrected colors. When you change the frame rate option, that option is applied to the next test pattern you select unless it is not available for that pattern. If a selected frame rate is not available, the default frame rate is applied for the test pattern display.

Adjusting the integrator rod and fold mirror
Understand how to adjust the integrator rod and fold mirror to control the illumination spot on the DMD.

Extreme misalignment of projection optics can cause permanent damage to critical optical components. Only Christie qualified technicians can perform internal optical adjustments. The integrator rod and fold mirror adjustments are set by Christie. Make adjustments only if screen shadows are visible.

   When adjusting the fold mirror, set the light source to minimum power.

1. In the right toolbar, tap Test Patterns.
2. Select the RGB-4K-Integrator Rod test pattern and display it full screen.
Refer to the test pattern for guidance on making the adjustments. The right panel of the test pattern provides information about the integrator zoom and focus adjustments. The left panel provides information about the fold mirror adjustments.

3. Open the Service door on the side of the projector.

4. To use the integrator rod optical controls, open the access door for the Zoom and Focus paddles.

5. Loosen the lock screw for the Zoom and Focus paddles.
6. Set the integrator rod Zoom paddle to the minimum.

7. Loosen the fold mirror screws to unlock the fold mirror adjustment knobs.

8. To make horizontal adjustments on the fold mirror, use the orange adjustment knob. To make vertical adjustments on the fold mirror, use the purple adjustment knob.
9. Adjust the fold mirror until either the top left edge or the bottom right edge of the illumination spot becomes visible on the DMD.

10. Adjust the integrator rod Focus paddle to optimize focus for one of the following:
    - Along the top edge of the image, approximately one-third across the image from the left.
    - Along the bottom edge of the image, approximately one-third across the image from the right.

11. Adjust the fold mirror to center the image on the DMD array.

12. Use the integrator rod Zoom paddle to increase the zoom until the entire active area is filled, with no dark areas at the edges or corners.
    Ensure that overfill is minimized to improve DMD life and system optical efficiency for brightness.

13. Once the adjustments are complete, tighten the lock screw for the Zoom and Focus paddles, and the two fold mirror screws.

14. Close the access door for the Zoom and Focus paddles.
Adjusting boresight

A boresight adjustment balances the tilt of the lens mount to compensate for screen-to-projector tilt.

**Warning!** If not avoided, the following could result in death or serious injury.

- Do not look directly into the lens when the light source is on. The extremely high brightness can cause permanent eye damage.
- **FIRE HAZARD!** Keep hands, clothes, and all combustible material away from the concentrated light beam of the projector.

**Caution!** If not avoided, the following could result in minor or moderate injury.

- This procedure must be performed by Christie qualified technicians.

When making the adjustments, set the light source to minimum power.

To following steps are intended to achieve the highest quality image distributed across the full screen.

1. Close the shutter on the projector to avoid accidental exposure to the projection beam when working in close proximity to the projection lens.

2. Using a 3 mm driver, unlock the horizontal and vertical lock screws (Lock A, B, and C).

   To unlock the vertical lock screw (Lock C), flip open the cover flap (G) using the screwdriver.

3. Open the shutter on the projector.
4. In the right toolbar, tap **Test Patterns**.
5. Select the **RGB-4K-Boresight** pattern and display it full screen.

   ![Image of RGB-4K-Boresight pattern]

   When adjusting the boresight screws, ensure that the shutter is closed to avoid accidental exposure to the projection beam when operating in close proximity to the projection lens. Open the shutter only to view the test pattern.

6. Start with the horizontal boresight adjustment. Use the ILS controls to move the projection lens into the projector, or turn the manual focus knob (F) counterclockwise to slightly defocus the green cross-hair patterns (+) at the right and left edges of the test pattern.
7. Use the ILS controls or turn the focus knob (F) clockwise to begin focusing the image. Watch for either the left or right cross-hair patterns (+) to come into focus.
8. If the left side comes into focus first, use a 5 mm driver to turn the horizontal boresight adjustment screw (E) clockwise until the left and right are equally out of focus.
   If the right side comes into focus first, turn the horizontal boresight screw counterclockwise.
9. Repeat steps 6 to 8 as required to obtain an even focus at the right and left edges of the screen.
10. Next perform the vertical boresight adjustment. Use the ILS controls to move the projection lens into the projector, or turn the focus knob (F) counterclockwise to slightly defocus the green cross-hair patterns (+) at the top and bottom of the screen.
11. Use the ILS controls or turn the focus knob (F) clockwise to begin focusing the image. Watch for either the top or bottom cross-hair patterns (+) to come into focus.
12. If the bottom comes into focus first, use a 5 mm driver to turn the vertical boresight adjustment screw (D) counterclockwise until the top and bottom are equally out of focus. If the top comes into focus first, turn the vertical boresight screw clockwise.

13. Repeat steps 10 to 12 as required to obtain an even focus at the top and bottom of the screen.

14. Once the correct focus has been achieved, lock the three lock screws.

When locking the lock screws, start with the horizontal lock screws (Lock A and Lock B) and turn them until they just touch the base. Repeat for the vertical lock screw (Lock C). Continue the gradual tightening of each screw, until all lock screws are tight.

When stabilizing image vibration, Lock B may be left locked or unlocked at the discretion of the installer.

15. If you used the focus knob (F) to make the adjustments manually, run an ILS auto calibration.

16. Fine tune the focus on cross-hair patterns I (horizontal) and II (vertical) using the ILS controls only.

The goal is to obtain good focus at the center and on all sides of the screen, including the square patterns across the screen.

### Adjusting DMD convergence

A convergence problem occurs when one or more projected colors (red, green, and blue) appears misaligned when examined with a convergence test pattern.

The three colors should overlap to form pure white lines throughout the image and one or more poorly converged individual colors may appear adjacent to some or all of the lines.

When adjusting the convergence, you are adjusting red and green to blue.

If you wear glasses with corrective lenses when performing this adjustment, ensure that you are viewing the test pattern on a straight angle through the optical axis of your glasses, and not from a tilted or angled perspective. This avoids a prismatic effect that can appear to shift convergence when viewing at an angle.

1. Before adjusting DMD convergence, ensure the projector has reached a steady operational state. If switching from a white or bright test pattern to a dark convergence test pattern, or if warming up the projector after a shutdown, allow 15 minutes for stabilization so that the optics can reach a steady state.

2. In the right toolbar, tap **Test Patterns**.

3. Select the **RGB-4K-Convergence** test pattern and display it full screen.
4. Open the Service door on the side of the projector.

5. To adjust the convergence knobs, use the 3 mm driver included with the projector.
   If adjusting by hand without using the tool, pull out the convergence adjustment knobs to engage them.

6. Use the Convergence test pattern to assist with adjusting the horizontal and vertical lines.
Horizontal adjustments are controlled by adjusting knob 3.
Vertical convergence and rotation are controlled by adjusting knobs 1 and 2. Christie recommends rotating a single knob a maximum of a quarter rotation before adjusting the second knob a quarter rotation. For example, if using one hand, turn the left knob a quarter rotation and then the right knob a quarter rotation, and so on. Adjusting a single knob for vertical or rotational adjustment to an extreme before adjusting the second knob may result in the convergence mechanism binding.

For the best stability, Christie recommends setting convergence while rotating the knobs in a clockwise direction. This may require first adjusting convergence by turning the knobs counter-clockwise, and finalizing the convergence with a clockwise approach. This applies to all knobs.

7. When complete, push in all the convergence adjustment knobs to disengage them.

Correcting on-screen color

After installation, further image adjustments may be required to correct color on the screen. The next steps may include creating a Measured Color Gamut Data (MCDG) file and configuring a Pureformity Color™ Technology (PCT) file to achieve optimal color and brightness uniformity. For more information on managing color settings, see the CineLife+ RGB PLF User Guide (P/N: 020-103073-XX).
Regulatory

This product conforms to the latest regulations and standards related to product safety, environmental, and electromagnetic compatibility (EMC) requirements.
