
Technical Bulletin

Fiber connector safety

This bulletin provides information regarding the importance of not removing the fiber connector when the projector is powered on.

Warning! If not avoided, the following could result in death or serious injury.

- Laser hazard. To avoid personal injury, avoid eye or skin exposure to direct or scattered radiation.

The fiber optic cable is connected from the laser unit to the projector. Once the fiber optic cable is connected, it is permanently installed at the output port on the laser unit and must remain installed unless cleaning is required.

The fiber connector must not be removed from the projector unless the system is completely powered down.

Once the system is disconnected from AC power and the fiber connector is removed, make sure the fiber connector safety cover is installed on the fiber connector. For more information, see the service guide for your projector model.

Affected products

The following products are affected:

- Christie Eclipse
- E3LH TPLS
- Mirage SST
